

Asset Management Policy

Langate Group

Purpose

The purpose of this policy is to define requirements for managing and properly tracking assets owned, managed, and under the control of Langate Group through their lifecycle from initial acquisition to final disposal.

Roles and Responsibilities

- **IT Manager** is responsible for policy implementation.
- **ISMS manager** is responsible for updating, reviewing, and maintaining this policy.

Policy

Physical and Virtual Asset Standard

Langate Group will ensure the proper management of assets to maximize information security. The following procedures will be enforced as applicable to Langate Group assets to ensure proper maintenance, tracking, monitoring, and handling of assets:

- A detailed asset inventory will be maintained to track and monitor assets.
 - All significant assets will be accounted for on the inventory.
 - Items can be excluded from the inventory if they carry very low purchase/replacement costs (including time and labor needed to install and configure) and pose little or no risk to business operations or compliance status.
- Each significant asset will be associated with an identifier, license, or tag, and proper classification when applicable.
 - Details should include a description of the type of asset, its make/model, technical specifications, license details, and versions of the software packages or operating systems.
 - Assets that contain, store, or handle information will be classified per the *Data Classification Policy*.
- Access to each asset will be restricted based on the asset's classification.
- A record of authorized recipients of assets will be established and maintained.
- The disposal/replacement of physical and virtual assets will be tracked, whether it is due to depreciation, expiring leases or agreements, obsolescence/end of support, loss, or other reasons.
- A reporting function will support auditing and monitoring for IT compliance with this standard.

Asset Inventory Standard

An asset inventory process must be in place to support the technological management of critical business processes and to meet legal and regulatory requirements. The inventory process will also support the discovery, management, and replacement/ disposal of all assets. It will further facilitate the identification and removal of any illegal or unauthorized software, asset, or process found in the Langate Group environment. To accomplish these goals, all physical and virtual assets under Langate Group management will be listed in an inventory that will include:

- Unique identifier or name of the asset.
- Description of the asset.
- The purpose of the asset and the role the asset has in supporting critical business processes and meeting legal or regulatory requirements, if applicable.
- Entity responsible for the asset.
- Assets that contain sensitive information (e.g., PHI, personal data, etc.) shall be clearly designated as such for the purposes of tracking.
- Classification of the asset, if applicable, as prescribed in the *Data Classification Policy*.

Asset Ownership

Langate Group will assign an owner to each asset when the asset is created or transferred to Langate Group. The asset owner can be an individual or an entity with approved management responsibility to control the whole lifecycle of the asset; the asset owner will not necessarily have property rights to the asset.

The asset owner will be responsible for the proper management of the asset over the asset's entire lifecycle or until a new owner is assigned to the asset. The asset owner will:

- Ensure that assets are inventoried.
- Ensure that assets are appropriately classified and protected.
- Define and periodically review access restrictions and classification to important assets, taking into account applicable access control policies.
- Ensure proper handling when the asset is deleted/destroyed.

Physical Asset Inventory

Langate Group leverages a SaaS-based asset management system, *ITFin*, to maintain inventory of all company-owned physical computing equipment, including but not limited to:

- Servers
- Workstations
- Laptops
- Printers
- Networking equipment

All company-owned devices are subject to a complete data wipe if deemed necessary, such as in the case of device infection or repurpose. The IT administrator will wipe this data.

Digital Asset Inventory

Langate Group uses *Drata*'s automated system to query across our cloud-based infrastructure to obtain detailed records of all digital assets, including but not limited to:

- Virtual machines
- Virtual servers
- Virtual repositories
- Software
- Security agents
- Source code repositories
- User accounts
- Digital files (documents, videos, images, etc.)

Records are kept up to date through automation via *Drata* when applicable. Digital files are stored in *OneDrive* in the appropriate channels.

Asset Retirement Standard

The information resource owner determines when an asset is no longer needed or is obsolete and can be retired. If the asset to be replaced/retired supports mandatory legal and regulatory requirements of critical business processes, the information resource owner must ensure that any replacement asset can support these processes before the current asset is retired.

Before retiring/replacing any asset that retains data, data retention requirements for all data stored or managed by that asset must be reviewed, and a plan for complying with all applicable data retention requirements must be developed and executed. This is particularly important for assets that manage data subject to legal/regulatory scrutiny. Any data subject to data retention requirements must be migrated to an appropriate destination and tested for appropriateness, completeness, accessibility, and retrievability from the destination before the original data is deleted from the original asset as part of the system retirement process.

Capacity Management

System capacity requirements will be identified in line with the business criticality of a concerned system.

- System tuning and monitoring will be applied to ensure and improve (when needed) the availability and efficiency of systems.
- Detective controls will be put in place to indicate problems as they occur.
- Projections of future capacity requirements will account for new business and system requirements and current and projected trends in the company's information processing capabilities.
- To mitigate bottlenecks and dependence on key personnel that present a threat to system security or services, managers must monitor the utilization of key system resources, identify trends in usage, and account for any resources that may have long procurement lead times or high costs.

Providing sufficient capacity will be achieved by increasing capacity or by reducing demand. This includes:

- Deletion of obsolete data (disk space).
- Decommissioning of applications, systems, databases, or environments.
- Optimizing batch processes and schedules.
- Optimizing application logic or database queries.
- Denying or restricting bandwidth for resource-hungry services if these are not business critical (e.g, video streaming).
- Managing capacity demand.
- Provisioning new server instances when capacity thresholds are met.

Management of Media

Removable Media

For the proper management of removable media, the following steps will be taken when applicable:

- Authorization will be required to remove media from Langate Group facilities or assets when necessary and practical.
- Contents of any reusable media being retired or replaced will be made unrecoverable.
- All media will be stored and secured in accordance with manufacturers' specifications.
- Cryptographic techniques should be used to protect data on removable media to maintain integrity and confidentiality.
- Media degradation will be mitigated by transferring stored data to fresh media before becoming unreadable.
- Coincidental data damage or loss will be mitigated by making multiple copies of valuable data on separate media.
- Removable media drives will only be enabled if there is a business reason for it.

Physical Media Transfer

For the protection of media containing information during transport, the following steps will be taken when applicable:

- Reliable transport/couriers will be used.
- The packaging of media will be sufficient to protect the contents from any physical damage during transport and will be in accordance with any manufacturers' specifications.
- Transfers will be logged with information.
 - Information about content of the media.
 - Type of protection applied.
 - Time of transfer to transport custodian.
 - Time of receipt at destination.

Return of Assets Upon Termination

- The termination process includes returning all previously issued physical and electronic assets owned by or entrusted to Langate Group, as outlined in the *Employment Terms and Conditions*, *Contractor Agreement*, and *Asset Management Policy*.
- If Langate Group equipment was purchased by an employee, contractor, or third-party user, or personal equipment was used, all relevant information must be transferred to Langate Group and securely erased from the equipment.
- Unauthorized copying of information by employees, contractors, and third-party users will be controlled during the termination period.

Disposal of Media

The steps for the secure disposal of media containing confidential information will be proportional to the sensitivity of that information. The following guidelines will be applied accordingly:

- Identification of items that require disposal.
- Use of appropriate third-party collection and disposal services in accordance with the *Vendor Management Policy*.
- Secure disposal by incineration or shredding or erasure of data for use by another application within the company.
- Risk assessment of damaged media to determine disposal or repair.
- Whole-disk encryption to mitigate the risk of disclosure of confidential information, in line with Langate Group *Encryption Policy*.
- Logging each disposal to maintain an audit trail.
