

Backup Policy

Langate Group

1. PURPOSE, SCOPE, AND USERS

1.1 The purpose of this document is to describe approaches to protecting the confidentiality, integrity, and availability of data through backup to ensure that data remains available when it is needed and can be recovered in the case of a disaster.

1.2 This document applies to the entire Information Security Management System (ISMS) scope, i.e., to all systems, equipment, facilities, and information used within the ISMS scope.

1.3 This document's users are all employees and contractors of Langate Group.

2. REFERENCE DOCUMENTS

- ISO 27001 standard, clauses A.12.3.1
- Information Security Policy
- ISMS Scope Document
- Risk Assessment and Risk Treatment Methodology
- Risk Assessment and Treatment Table

3. ACRONYMS / DEFINITIONS

- **Skykick** - Backup service for Microsoft 365.
- **Cove Backup** - Cloud-based backup service for virtual machines.
- **Azure Blob Storage** - A service for storing large amounts of unstructured data such as text or binary data.
- **Azure Virtual Machines** - On-demand, scalable computing resources provided by Microsoft Azure.
- **Backup Administrator(s)** - Responsible for the initial configuration and modification of backup systems and for controlling the backup and recovery process.
- **Backup Rules** - Requirements for the creation time, frequency of creation, and retention periods of backups.
- **Information Resource Owner** - The person responsible for coordinating the rules for backup.

4. GENERAL PROVISIONS

The purpose of backup is to prevent information loss in case of hardware or software failures in critical and emergency situations and to eliminate consequences in case of their occurrence. The backup system ensures high availability of information systems. A decentralized backup system has been implemented to reduce the total cost of ownership of IT infrastructure by optimizing the use of backup devices and reducing administration costs. The following main categories of information are backed up:

- Systems running on Microsoft Azure
- Systems running on Microsoft 365
- Systems running on office servers
- Systems running in private cloud
- The logs of the office systems

5. BACKUP SYSTEMS RUNNING ON MICROSOFT AZURE

5.1 Systems running on Microsoft Azure are instances with operating systems or Azure-managed services. They are backed up automatically to either Azure Blob Storage or the Cove Backup service. During the backup, a snapshot of the running system is made. If necessary, the system is restored from a previously created snapshot.

5.2 The frequency of backups, their storage time, and the need to perform a backup depend on the instance's importance and are determined individually for groups of instances by the owner of the information resource.

6. BACKUP SYSTEMS RUNNING ON MICROSOFT 365

6.1 Systems running on Microsoft 365 are backed up automatically by the Skykick Backup service. During the backup, a snapshot of the running system is made. If necessary, the system is restored from a previously created snapshot.

6.2 Backup copies of Microsoft 365 systems are created daily.

7. BACKUP AND RESTORE OF SYSTEMS RUNNING ON OFFICE AND PRIVATE CLOUD SERVERS

7.1 All servers running in the office are virtual machines located on local servers. Virtual machine backups (casts) are saved on another server, allowing for cross-copying and storing backups. Additionally, these servers are backed up by Cove Backup.

7.2. All systems running in the private cloud are virtual machines that are backed up by Cove Backup. During the backup, a snapshot of the running system is made. If necessary, the system is restored from a previously created snapshot.

7.3 Systems are restored by from Cove through a restore management console. The data is restored to the state when the last virtual machine snapshot was created.

7.4 Virtual machines are backed up daily, and the last two weeks of backups are retained.

8. BACKUP OF OFFICE SYSTEM LOGS

Office network equipment logs are written online to a server in the office and copied to Azure Blob Storage once a day. The logs are stored throughout the year.

9. INFORMATION RECOVERY

Information recovery from backups is carried out in critical and emergency situations in case of equipment or software failures that lead to system failure.

10. MONITORING BACKUP RESULTS

The Backup Administrator is responsible for:

- Ensuring the frequency and completeness of backups
- Ensuring the performance of all components of the backup system
- Implementing measures to eliminate failures in the centralized backup system
- Regularly monitoring the results of all procedures
- Periodically checking whether files can be restored from backups

11. VALIDITY AND DOCUMENT MANAGEMENT

The owner of this document is the ISMS Manager, who should check and, if necessary, update the document at least once a year.

In assessing the effectiveness and adequacy of this document, the following criteria should be taken into account:

- number of incidents related to the inability to restore information from backups;
- number of incidents related to the lack of backup copies of important information.

Policy version history

 Policy details

Policy name	Renewal date
Backup Policy	September 26, 2026
Description	
A backup policy is a pre-defined, set schedule whereby information from business applications are copied to ensure data recoverability in the event of accidental data deletion, corrupted information or some kind of a system outage.
