

Disaster Recovery Plan

Langate Group

Purpose

This policy establishes procedures for recovering Langate Group following a disruption resulting from a disaster, with a focus on recovering technology facilities and platforms, such as critical applications, databases, servers, or other required technology infrastructure.

Background

The following objectives have been established for this plan:

- Maximize the effectiveness of contingency operations through an established plan that consists of the following phases:
 - **Notification/Activation phase** to detect and assess damage and to activate the plan.
 - **Recovery phase** is to restore temporary operations and recover damage done to the original system.
 - **Reconstitution phase** is to restore system processing capabilities to normal operations.
- Identify the activities, resources, and procedures needed to carry out Langate Group processing requirements during prolonged interruptions to normal operations.
- Identify and define the impact of interruptions to Langate Group systems.
- Assign responsibilities to designated personnel and provide guidance for recovering Langate Group systems during prolonged periods of interruption to normal operations.
- Ensure coordination with other Langate Group staff who will participate in the Disaster Recovery Planning strategies.
- Ensure coordination with external points of contact and vendors who will participate in the Disaster Recovery Planning strategies.

Policy

Examples of the types of disasters that would initiate this plan are natural disasters, political disturbances, military operations, man-made disasters, external human threats, and internal malicious activities.

Langate Group defines two categories of systems from a disaster recovery perspective:

- **Critical Systems.** These systems host application servers and database servers or are required for the functioning of systems that host application servers and database servers. These systems, if unavailable, affect the integrity of data and must be restored or have a process begun to restore them immediately upon becoming unavailable.
- **Non-critical Systems.** These are all systems that are not considered critical by the definition above. These systems, while they may affect the performance and overall security of critical systems, do not prevent Critical systems from functioning and being accessed appropriately. These systems are restored at a lower priority than critical systems.

Threat and Risk Assessment and Management

There are many potential disruptive threats which can occur at any time and affect the normal business process. We have considered a wide range of potential threats and the results of our deliberations are included in this section. Each

potential environmental disaster or emergency situation has been examined. The focus here is on the level of business disruption which could arise from each type of disaster.

The Langate Group Risk Assessment documents a full, detailed assessment of threats.

Testing and Maintenance

The Security Officer shall establish criteria for validating/testing a Disaster Recovery Plan and an annual test schedule and ensure the test's implementation. This process will also serve as training for personnel involved in the plan's execution. The types of validation/testing exercises include tabletop and technical testing.

Tabletop Testing

The primary objective of the tabletop test is to ensure that designated personnel are knowledgeable and capable of performing the notification/activation requirements and procedures as outlined in the Disaster Recovery Plan in a timely manner. The exercises include but are not limited to:

- Testing to validate the ability to respond to a crisis in a coordinated, timely, and effective manner by simulating the occurrence of a specific crisis.

Technical Testing

The primary objective of the technical test is to ensure the communication processes and data storage and recovery processes can function at an alternate site to perform the functions and capabilities of the system within the designated requirements. Technical testing shall include but is not limited to:

- Process from the backup system at the alternate site
- Restore system using backups
- Switch compute and storage resources to alternate processing sites.

Disaster Recovery Procedures

Notification and Activation Phase

This phase addresses the initial actions taken to detect and assess damage inflicted by a disruption to Langate Group. Based on the assessment of the Event, sometimes, according to the Langate Group *Incident Response Policy*, the Security Officer and/or Project Manager may activate the disaster recovery plan.

Notification Sequence

- The first responder must notify the Security Officer and/or Project Manager, who must receive all known information.
- The Security Officer and/or Project Manager will contact the rest of the team and inform them of the event. The Security Officer will then begin assessment procedures.
- The Security Officer and/or Project Manager is to notify team members and direct them to complete the assessment procedures outlined below to determine the extent of damage and estimated recovery time. The Security Officer and/or Project Manager must follow the steps below if damage assessment cannot be performed locally because of unsafe conditions.

Damage Assessment

- The Security Officer and/or Project Manager is to assess damage logically, gain insight into whether the infrastructure is salvageable, and begin to formulate a plan for recovery.

Alternate Assessment

- Upon notification, the Security Officer and/or Project Manager must follow the damage assessment procedures with combined DevOps and Web Services Teams.
- The Langate Group Disaster Recovery Plan is to be activated if one or more of the following criteria are met:
 - Langate Group systems will be unavailable for more than 48 hours.
 - The hosting facility is damaged and will be unavailable for more than 24 hours.
 - Other criteria, as appropriate and as defined by Langate Group.
- If the plan is to be activated, the Security Officer and/or Project Manager will notify and inform team members of the event's details and whether relocation is required.
- Upon notification from the Security Officer and/or Project Manager, group leaders and managers should notify their respective teams. Team members should be informed of all applicable information and prepared to respond and relocate if necessary.
- The Security Officer and/or Project Manager will notify the hosting facility partners that a contingency event has been declared and will ship the necessary materials (as determined by damage assessment) to the alternate site.
- The Security Officer and/or Project Manager will notify the remaining personnel and executive leadership of the general status of the incident.
- Notification can be delivered via message, email, or phone.

Recovery Phase

This section provides procedures for recovering the application at an alternate site, whereas other efforts are directed to repair damage to the original system and capabilities.

The following procedures are intended to restore the Langate Group infrastructure to an alternate site. The procedures are described for each required command. Each procedure should be performed in the sequence presented to maintain operational efficiency.

Recovery Goal

The goal is to rebuild Langate Group's infrastructure to a production state. The tasks outlined below are not sequential, and some can be run in parallel.

1. Contact the Partners and Customers affected.
2. Assess damage to the environment.
3. Begin replication of new environment using automated and tested scripts. At this point, whether to recover in Azure, Rackspace, AWS, GCP, Heroku, or another cloud environment is determined.
4. Test the new environment using pre-written tests.
5. Test logging, security, and alerting functionality.
6. Ensure systems are appropriately patched and up to date.
7. Deploy environment to production.
8. Update DNS to the new environment.

Reconstitution Phase

This section discusses activities necessary for restoring Langate Group operations at the original or new site. The goal is to restore full operations within 24 hours of a disaster or outage. When the hosted data center at the original or new site has been restored, Langate Group operations at the alternate site may be transitioned back. The goal is to provide a seamless transition of operations from the alternate site to the computer center.

Original or New Site Restoration

- Begin replication of new environment using automated and tested scripts (DevOps).

- Test new environment using pre-written tests (Web Services).
- Test logging, security, and alerting functionality (DevOps).
- Deploy environment to production (Web Services).
- Ensure systems are appropriately patched and up-to-date (DevOps).
- Update DNS to the new environment (DevOps).

Plan Deactivation

If the Langate Group environment is moved back to the original site from the alternative site, all hardware used at the alternate site should be handled and disposed of according to Langate Group policy.

Policy version history

 Policy details

Policy name	Renewal date
Disaster Recovery Plan	September 26, 2026
Description	
The disaster recovery plan (DRP) is our documented, structured approach that describes how our company can quickly resume work after an unplanned incident.
